

## Creating a simple database using FileMaker

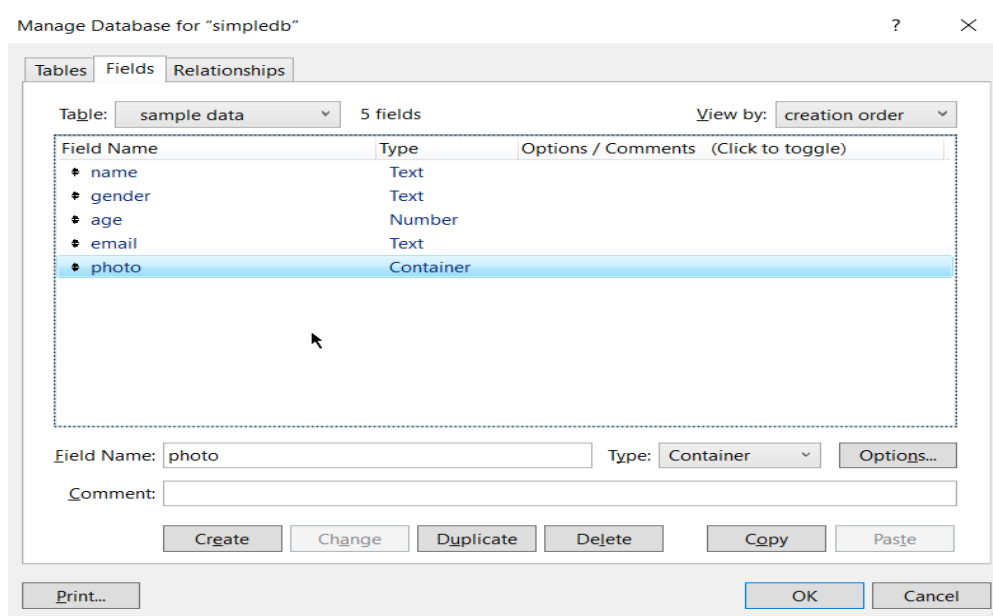

Create a new file using the “convert” tab. This tab allows you to import a dataset for FileMaker to work with.

Using the tab to the left of the screen, select “Use as Field Names” to see the fields that are being mapped. Deselect any fields you wish not to be imported to FileMaker.

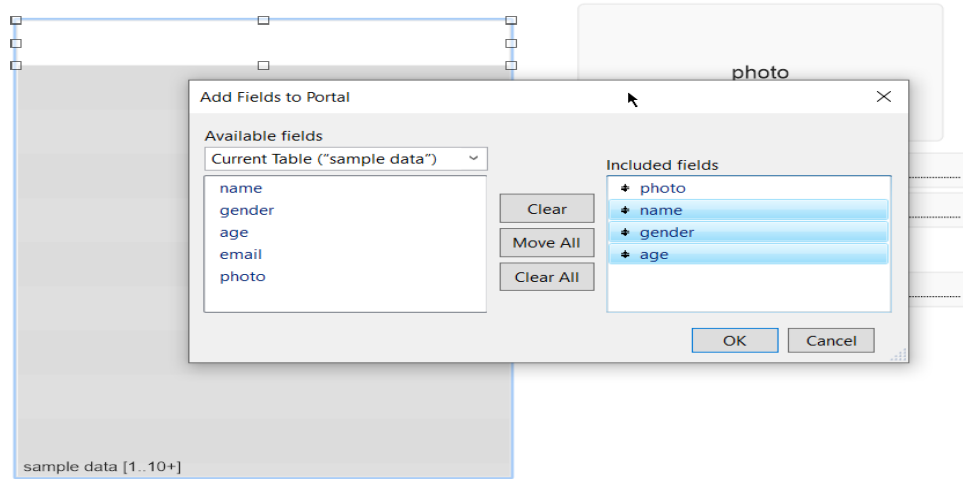

File > manage > database > fields

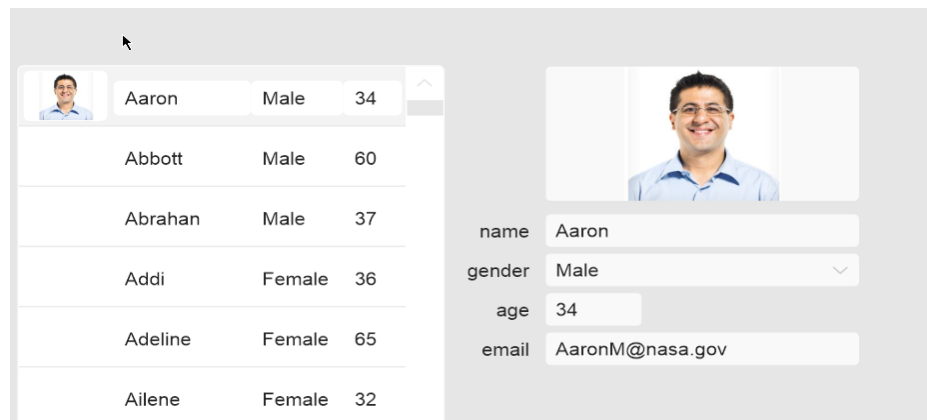

Creating a “photos” field with “container” type to allow for a picture of each client

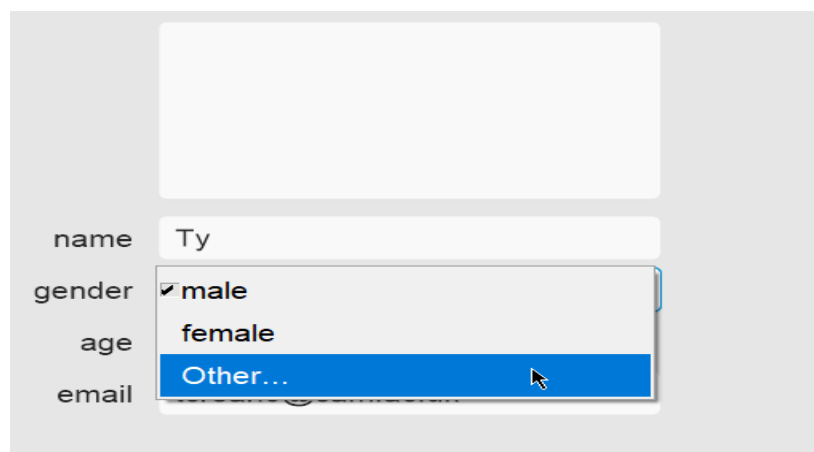

Created a portal showing database information, and included the fields I wish to be viewable

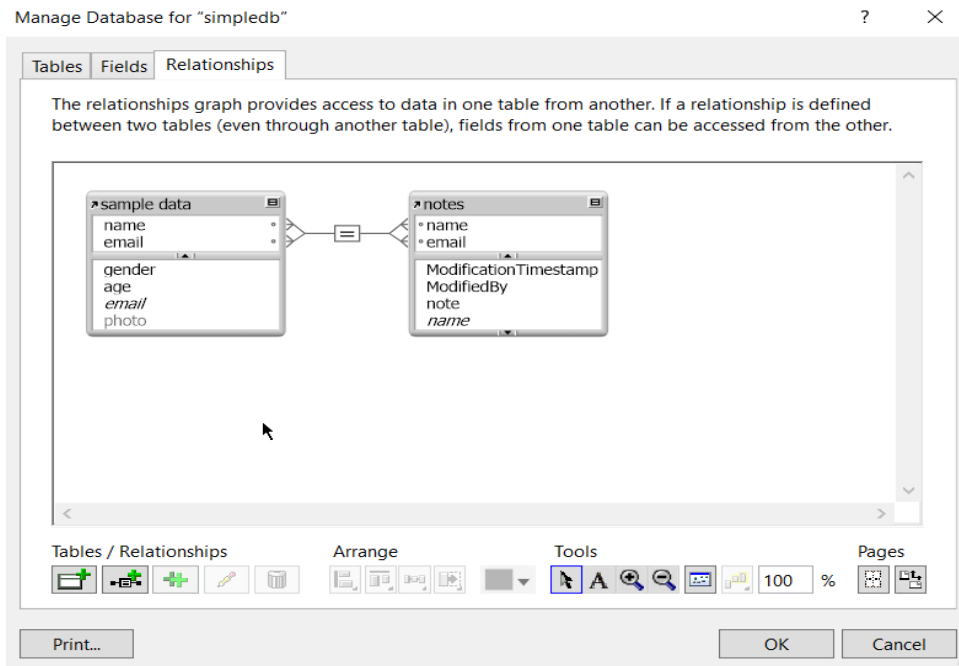

Created new record to show successful addition to database

Made gender field a drop-down menu for ease of entry and to allow for unique gender identification

Created a new table called “notes” as a child entity of the “sample data” table

Created a new portal showing unique records associated with that customer from “notes” table

Aaron note 1

Aaron note 2

name Aaron

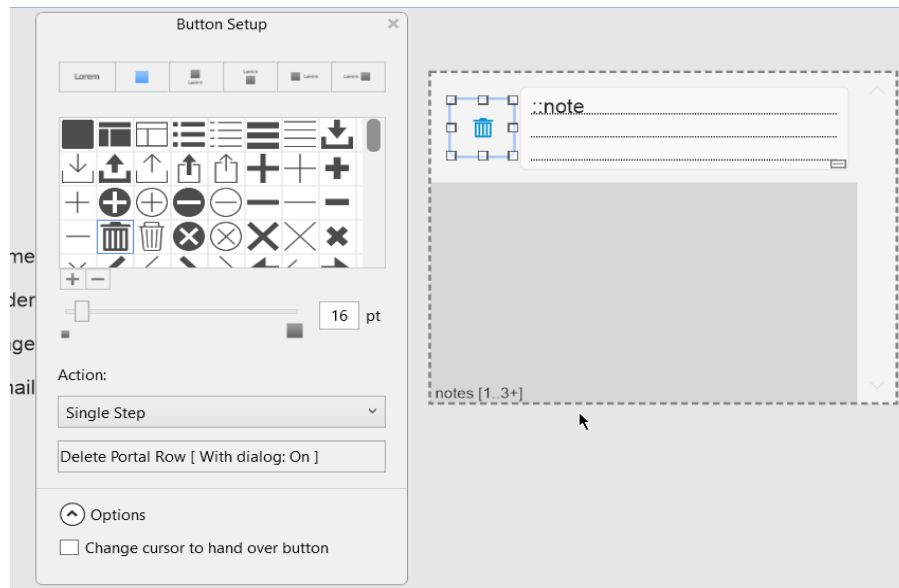

gender Male

age 34

email AaronM@nasa.gov

note

Created a delete button with a single action of “delete portal row” for each record entry

Added “New record” and “Delete record” buttons to add and remove data entries
